Versatile

Grout sensors for use in sea and fresh water environments with a Proserve Grout Monitor Unit.

Reliable

Successful use on two of the world's largest ongoing Dam and Barrage projects. Can be easily pre-fixed on land into otherwise hard-to-reach areas.

Stainless steel electrodes offer excellent resistance to harsh marine conditions.

Efficient

Economical construction from robust plastic water pipe (or similar), with dimensions to suit the individual project.

Cost Effective

Reusable sensors reduce diver monitoring work and allows construction to continue when a diver cannot be or is not in the water.

1" outside diameter plastic water pipe with 2 stainless steel riveted electrodes to maintain accurate measurement.
